

The study listed below is a pharmacokinetic study proposing new, de-escalated dosing strategies for ampicillin for the indication of non-meningitis neonatal sepsis to reduce the risk toxicity associated with high doses of ampicillin in neonates.

Study	Characterization of the Population Pharmacokinetics of Ampicillin in Neonates Using an Opportunistic Study Design
Citation	Tremoulet A, Le J, Poindexter B, et al. Characterization of the population pharmacokinetics of ampicillin in neonates using an opportunistic study design. <i>Antimicrob Agents Chemother.</i> 2014;58(6):3013-3020. doi:10.1128/AAC.02374-13
Objectives	<ul style="list-style-type: none"> - Characterize the developmental PK of ampicillin prescribed per standard of care to neonates across a wide age spectrum - Compare the pharmacodynamic target attainments of various dosing strategies
Study Design	<ul style="list-style-type: none"> - Open-label, multicenter, opportunistic, prospective PK study of ampicillin in neonates stratified by gestational age - 9 centers - N = 73 participants, 142 observed drug concentrations
Methods	<ul style="list-style-type: none"> - Drug concentrations measured by tandem mass spectrometry - PK Data analyzed using population nonlinear mixed-effects modeling - Monte Carlo simulations were conducted to determine the probability of target attainment for the time in which the total steady-state ampicillin concentrations remained above the MIC for 50%, 75%, and 100% of the dosing interval - N = 73 participants, 142 observed drug concentrations
Results	<ul style="list-style-type: none"> - Gestational Age \leq 34 weeks <ul style="list-style-type: none"> o Postnatal Age 0-7 days - 50 mg/kg/dose, Intravenous, EVERY 12 HOURS o Postnatal Age >7 days – 75 mg/kg/dose, Intravenous, EVERY 12 HOURS - Gestational Age >34 weeks – 50 mg/kg/dose, Intravenous, EVERY 8 HOURS
Use for new UW Health order panel	Will be used for de-escalation from meningitis dosing

The following organizations and studies were used in the NeoFax and Lexicomp recommendations and are considered high quality of evidence and strong recommendations per the GRADE criteria:

Recommended Dosing Tables

Ampicillin – Meningitis Dosing			
PNA	Dose	Frequency	
≤ 7 days	100 mg/kg	Every 8 Hours	
>7 days	75 mg/kg	Every 6 Hours	
Ampicillin – Non-meningitis Dosing			
GA	PNA	Dosing	Frequency
≤ 34 weeks	0-7 days	50 mg/kg	Every 12 Hours
	>7-28 days	75 mg/kg	Every 12 Hours
>34 weeks	0-28 days	50 mg/kg	Every 8 Hours
Ampicillin – Non-meningitis Dosing			
PNA	Dosing	Frequency	
> 28 days	50 mg/kg	Every 6 Hours	

Gentamicin – Neonatal Dosing			
GA	PNA	Dose	Frequency
< 30 weeks	≤ 14 days	5 mg/kg	Every 48 Hours
	≥ 15 days	5 mg/kg	Every 36 Hours
30 – 34 weeks	≤ 10 days	5 mg/kg	Every 36 Hours
	11-60 days	5 mg/kg	Every 24 Hours
≥ 35 weeks	≤ 7 days	4 mg/kg	Every 24 Hours
	8-60 days	5 mg/kg	Every 24 Hours

Acyclovir – Neonatal Dosing		
PMA	Dose	Frequency
<30 weeks	20 mg/kg	Every 12 Hours
≥30 weeks	20 mg/kg	Every 8 Hours

Metronidazole – Neonatal Dosing		
Loading Dose: 15 mg/kg ONCE		
PMA	Dose	Frequency
<34 weeks	7.5 mg/kg	Every 12 Hours
34-40 weeks	7.5 mg/kg	Every 8 Hours
>40 weeks	10 mg/kg	Every 8 Hours

Ceftazidime – Neonatal Dosing		
PNA	Dose	Frequency
≤7 days	50 mg/kg	Every 12 Hours
8-28 days	50 mg/kg	Every 8 Hours

Vancomycin – Neonatal Dosing			
PMA	PNA	Dose	Frequency
≤29 weeks	0-14 days	15 mg/kg	Every 18 Hours
	>14 days	15 mg/kg	Every 12 Hours
30-36 weeks	0-14 days	15 mg/kg	Every 12 Hours
	>14 days	15 mg/kg	Every 8 Hours
37-44 weeks	<7 days	15 mg/kg	Every 12 Hours
	>7 days	15 mg/kg	Every 8 Hours

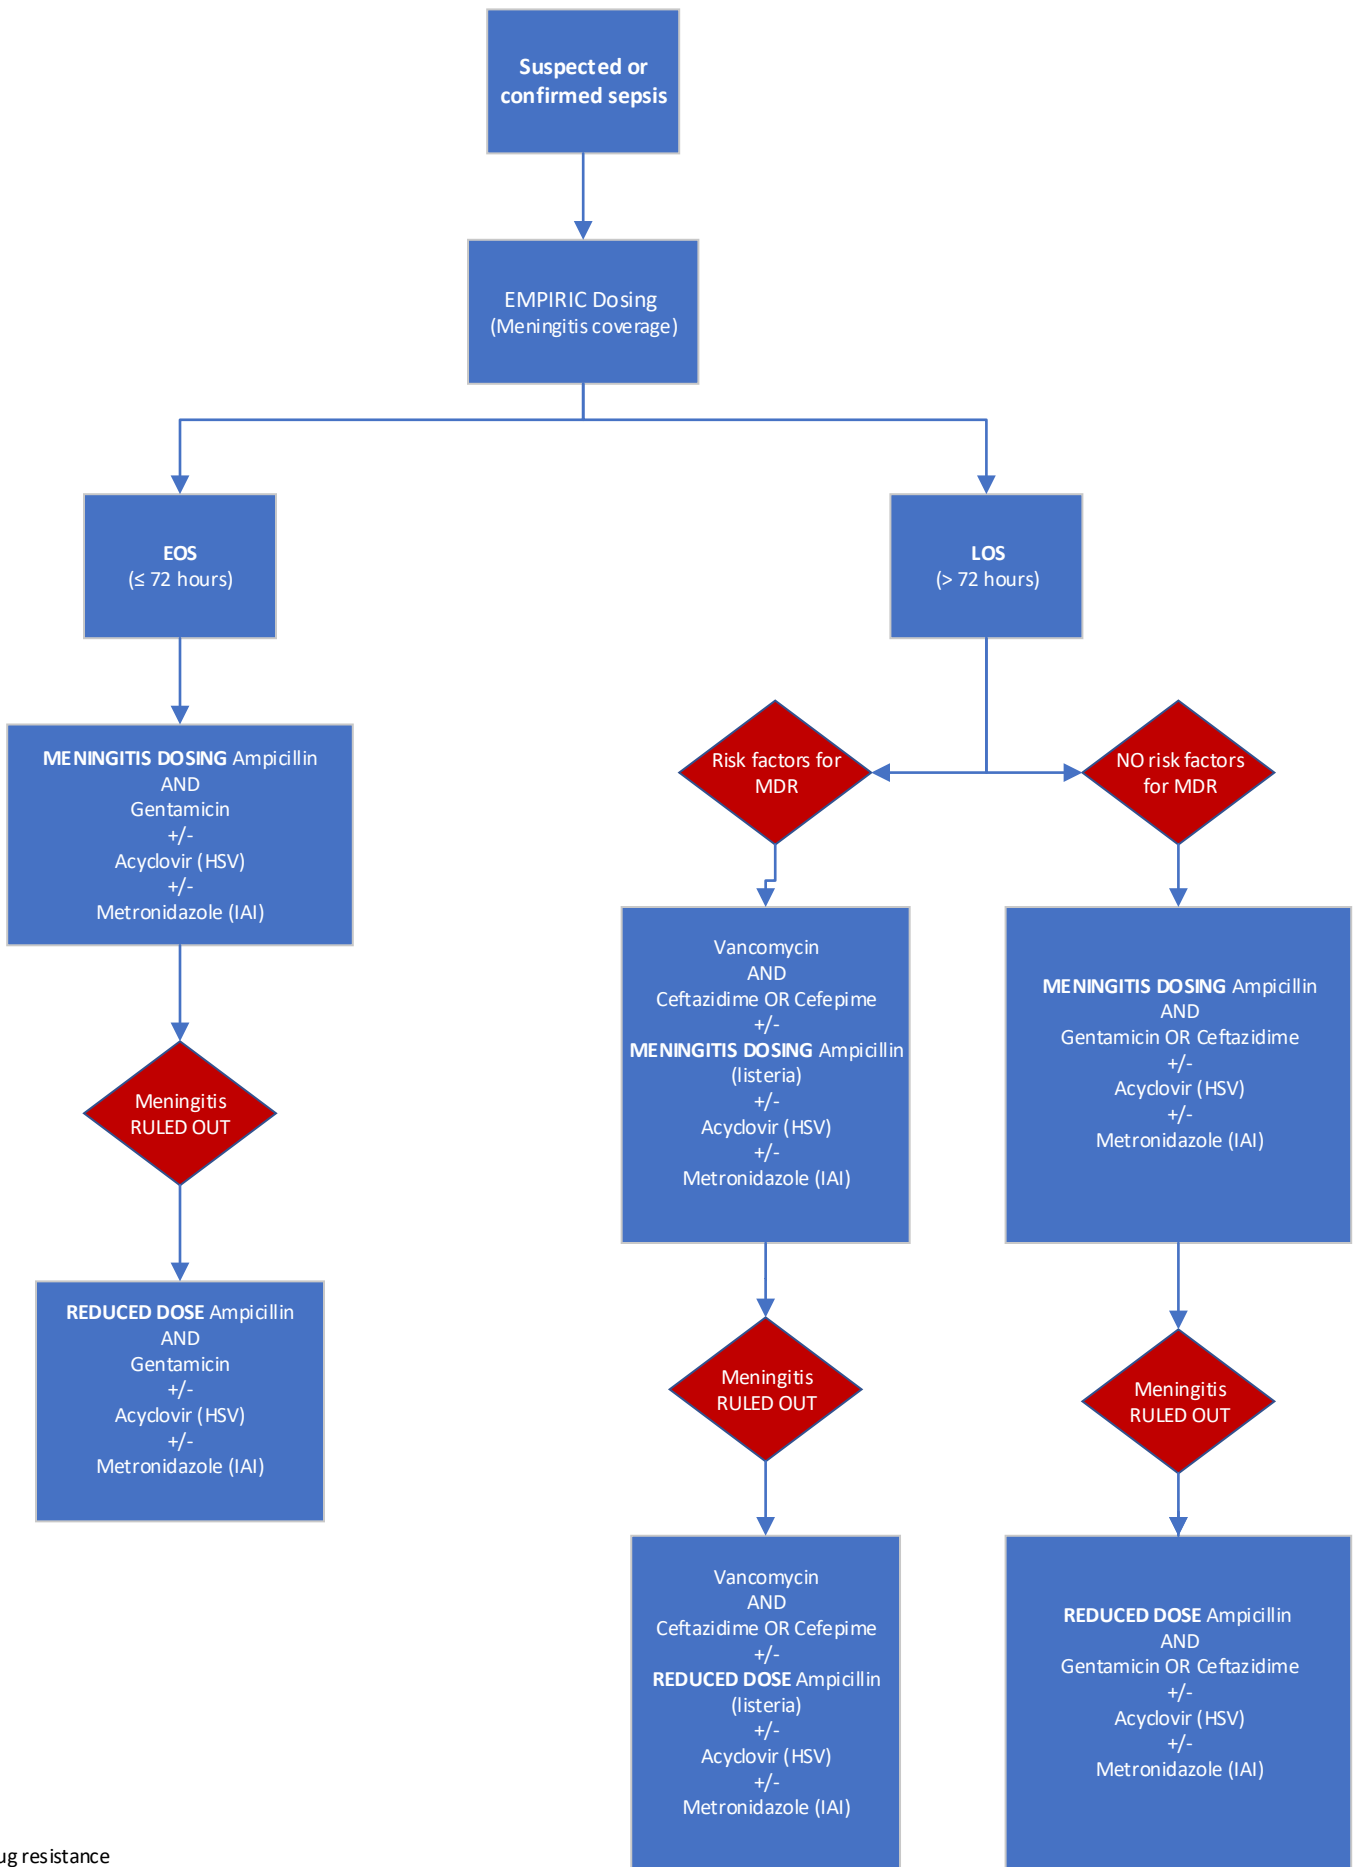

Cefepime – Neonatal Dosing		
PMA	Dose	Frequency
<44 weeks	50 mg/kg	Every 12 Hours

Gestational Age (GA): Time elapsed between the first day of the last menstrual period and the day of delivery; reported in weeks

Postnatal Age (PNA): time elapsed after birth-often considered the chronological age; reported in days, weeks, months

Postmenstrual Age (PMA): gestational age plus postnatal age; reported in weeks

Antibiotic Selection Algorithm below.

-MDR: Multi-drug resistance

-HSV: Herpes Simplex Virus

-IAI: Intra-abdominal Infection

-Risk factors for MDR: previous antibiotic use (specifically broad spectrum/cephalosporin), previous NICU stay, prolonged hospitalization, prolonged antibiotic therapy, presence of a central line or other invasive device, previous infection with MDR organism, neutropenia, underlying renal dysfunction

-Narrow antibiotic therapy appropriately when/if culture results available

-Broaden to other broad spectrum antibiotic if hx of MDR organism resistant to vanco +/- ceftaz or cefepime (ex: zosyn, meropenem)
